

One Way Spike Unit & End Caps

Product Fact Sheet

The MG101 One Way Spikes Unit is a heavy duty steel ramp fitted with 5 spring loaded spike cartridges (supplied). The spikes, or 'teeth', retract when driven over from the correct side, if driven from the wrong side the teeth will impact on the vehicle's tyres.

Although these are non-aggressive spikes, they can still cause damage to a vehicle's tyres which acts as a deterrent. These units can be placed on one way roads to regulate traffic or on restricted pathways to stop entry for vehicles altogether.

The cartridges are easily removable when required and replacements can be found on our website (MG103).

We also recommend the unit End Caps (MG102) to go with this item, these are sold separately to allow units to be customised by adding extra centre units for wider systems. These End Caps provide a sloped finish and are pedestrian friendly.
